

# C6 TAILPIPE LEDS

Use a # 15 torx bit to remove one of the license plate Housings. Peel back some of the covering on the wires so you can install the t-taps. Place one wire in the metal V of the t-tap and snap shut with a pair of pliers. Repeat for both wires.

Fish the red and black led wires up through the license light opening keeping wires away from the exhaust and plug the red wire into the brown wire connector and the black to the black as shown. Turn on the lights to test.

Now drop the led strip down behind the trunk/hatch area to the tailpipe area.

Wipe the rear edge of the rear fascia above the tailpipes where the leds will be mounted with the alcohol pad.

Cut the very top off the adhesion promoter pack and squeeze the excess fluid back into the packet. Fold the top over and seal to preserve the fluid for other kits you may have purchased. Wipe a thin coat on the mounting area of the car and let dry.

Center the led strip over the exhaust and peel the red backing from the strip. Mount the led strip to the rear edge of the rear fascia as shown. Press and hold in place for a minute or two.
